Engineer and founder. I own *product, platform and delivery* in connected systems — from the physical install to multi-tenant SaaS.

Eight years in connected systems across industrial, automotive, healthcare and residential. I own both ends of the stack: the cloud and platform layer (data pipelines, MQTT fleets, LoRaWAN networks, multi-tenant software) and the physical one on site (panels, wiring, networks, energy optimization). Since 2025 I also run my own company, so I carry the P&L, the hiring and the delivery — not just the architecture.

DECISIONS

SCOPE & CONSEQUENCE

Built the monitoring platform instead of buying it
Off-the-shelf tools gave no per-client portal with scoped access, and could not carry the energy-anomaly logic the business actually sells. Built in-house as multi-tenant software with audit logs and encrypted tokens — monitoring went from a cost to something we charge for.

Productized the installation instead of quoting bespoke
Every quote was a one-off, so delivery depended on me being in the room. Replaced it with closed packages, a device catalogue as the single source of truth and a dashboard generator fed from it — the team now delivers installations without me.

Wrote the build / integrate / ignore rule before building anything
The failure mode of an engineer-led company is rebuilding software that already exists, now that it is cheap to. Formalized a written gate applied before every project — build only what gains from owned data, wrap by API what the market solves, ignore commodities — so features get killed before they become debt.

Separated who produces from who verifies
A self-reported "done" is not evidence. Automated work runs behind an adversarial verifier with measurable stop conditions, hard caps, spend limits and a provider fallback chain — false claims get caught by machine, and the system keeps working when the main provider runs out.

EXPERIENCE

5 ROLES

IoT Subject Matter Expert — CURRENT

Pharma / Life Sciences sector

Dec 2025 – Present

- IoT architecture and data pipelines across manufacturing and R&D sites
- LoRaWAN networks with Tektelic Network Server, MQTT fleet (Mosquitto / Cedalo MMC), AWS data platform
- Platform integrations, onboarding playbooks and governance for industrial use-cases

Cloud Field Application Engineer

Proemion · Industrial IoT & Fleet Telematics

Jun 2023 – May 2026

- Primary technical liaison for IoT vehicle and fleet-management solutions, ensuring tailored integrations for OEM clients
- Configured and implemented Proemion DataPortal for client data visualization and cloud features
- Dedicated technical support, resolving integration challenges end-to-end

Co-founder & CEO CURRENT

Civitech · Smart Home & Energy Optimization

May 2025 — Present

- Founded and scaled a smart-home installation and energy-optimization company serving residential and B2B clients (laundries, offices, energy-intensive businesses)
- Designed a productized service line on Home Assistant + Shelly (Shelly Direct and Civitech Smart tiers) covering lighting, blinds, heating, AC, security and solar / PVPC-based automations
- Built the full technical stack: HA dashboards, generic package architecture, installation SOPs, monitoring (Grafana + InfluxDB + MQTT) and remote fleet management

Front-End Team Lead

Wise · AXA security tooling

Nov 2019 — Jan 2024

- Led a 4-person front-end team on a penetration-testing security platform built with Python (Flask) and .NET Core
- Responsive UIs in React.js; backend in Node.js + TypeScript, GraphQL and blockchain smart contracts
- CI/CD with Azure and GitHub Actions; mobile companion app in Flutter / Dart

IoT Engineer

Electrans · Railway sector

Jan 2018 — Nov 2019

- Desktop UIs in C# for railway operations
- Transitioned to IoT: data acquisition at train stations via Raspberry Pi (cellular), transmitted to central server
- Python and .NET for solution development; collaborative web platforms in JavaScript

PLATFORMS & PRODUCTS

ongoing	**Home-lab & SIEM**	Proxmox · observability, local LLM, zero-trust mesh, SIEM
2026	**Delta Dore cloud integration**	Closed manufacturer cloud · OAuth2 + WebSocket into Home Assistant
2023	**Boat tracking platform**	Runsolutions · TTN LoRaWAN, MQTT decoders, InfluxDB + Grafana
2023 — 24	**BLE medical gateway**	Imaginae · Raspberry Pi edge gateway, BLE, DDD architecture
2023	**Healthcare integrations**	Blendarsys · Mirth Connect, hospital APIs, secure exchange
2018 — 19	**Fleet tracking platform**	BWireless · real-time GPS telemetry, Python, customer map UI
2020 — 22	**dApps & ESP32 firmware**	Freelance · Solidity + React dApps, embedded ESP32 / Raspberry Pi

EDUCATION

FORMAL

2017 — 2018	**Master's Degree in Internet of Things**	UPC Barcelona
2012 — 2017	**BSc Electronic, Industrial & Automatic Engineering**	UIB Palma

CERTIFICATIONS

8 COURSES

2023 — 2024	Master in AI and Innovation	Founderz & Microsoft
2023	AZ-220 Microsoft Azure IoT Developer	Microsoft
2023	AZ-204 Developing Solutions for Microsoft Azure	Microsoft
2022	Scrum Master & Product Owner	PUE
2021	AZ-900 Azure Fundamentals	Microsoft
2020	Developer Program	Nuclio School
2018 — 2021	Home Automation	SAP School
2017	Ethical Hacking	The Security Sentinel
